DATA ANALYSIS

UNDERSTANDING

the Eklipse Creator Journey

Prepared by: Alisha Anggranidi Salsabila
Task: Eklipse AI Data Optimization Test

THE PURPOSE OF ANALYSIS

This analysis evaluates creator engagement, content interaction, and monetization performance across the Eklipse platform.

The analysis focuses on identifying business metrics that can support:

- platform growth
- creator retention
- creator satisfaction
- monetization strategy
- product optimization

KEY METRICS

- Creator Engagement Momentum
- Content Creation Activity
- Creator Value Realization
- Social Distribution Dynamics
- Monetization Expansion
- Content Format Preferences

These metrics were selected to evaluate how creators interact with the platform, how content performs, and how engagement contributes to monetization growth

UNDERSTANDING THE DATASET

DATA CHARACTERISTICS

The datasets represent different creator activities inside the Eklipse platform ecosystem

Each dataset captures:

- content generation
- creator interaction
- sharing behavior
- monetization activity

DATASET STRUCTURE

- gamesession: uploaded gameplay sessions
- clips: AI generated clips
- downloaded_clips: creator download activity
- shared_clips: social sharing activity
- premium: subscription activity

DATASET OVERVIEW

Dataset	Rows
clips	552K
gamesession	37K
downloaded_clips	12K
shared_clips	5.7K
premium	384

The datasets collectively represent the creator lifecycle, from content creation to monetization activity

DATA QUALITY & ANALYTICAL APPROACH

Before analysis, the datasets were evaluated for: missing values, timestamp completeness, and relational consistency

Missing Value Handling

Most missing values were found within timestamp related fields, primarily affecting timeseries analysis

For analytical consistency: rows with missing timestamps were excluded from time based calculations

Duplicate Prevention

COUNT DISTINCT was used to avoid duplicated user activity records during multi table analysis

Join Strategy

LEFT JOIN was used when unmatched records still provided analytical value

INNER JOIN was used when only valid related activities needed to be included

Based on the dataset distribution, content generation appears to be the platform's dominant operational activity

USER FLOW

This creator workflow becomes the foundation for selecting the engagement and monetization metrics used throughout the analysis

The funnel also illustrates show creator engagement may progress toward premium conversion

WHY THESE METRICS?

1. Engagement: Measures recurring creator activity across the platform
2. Content Value: Measures whether generated clips provide value to creators
3. Monetization: Measures how engagement contributes to premium adoption

The selected metrics were designed to evaluate the relationship between:

- creator behavior
- content interaction
- monetization performance

The metrics were selected to reflect different stages of the creator lifecycle

CREATOR ENGAGEMENT MOMENTUM

This metric measures
recurring creator activity
across:

- gamesession submissions
 - clip generation
 - downloads
- sharing behavior

eklipse_test

Methodology

UNION ALL was used to
combine multiple creator
activities

COUNT DISTINCT was applied
to avoid duplicated active users

Based on the active user trend, creator engagement
increased steadily throughout 2023

The strongest engagement growth
appeared during Q3–Q4 2023

Increasing creator engagement may contribute to stronger retention
and future monetization opportunities

eklipse_test

CONTENT CREATION & CREATOR VALUE

The gamesession trend reflects creator participation and platform activity

INNER JOIN was used between: gamesession and clips to include only gamesessions that successfully generated clips

Based on the gamesession trend, creator activity increased consistently throughout Q3–Q4 2023

Download rate measures how valuable generated clips are to creators

LEFT JOIN was used between: clips and downloaded_clips to preserve all generated clips, including clips that were not downloaded

According to the download rate trend, creators interacted more frequently with generated clips over time, indicating improving content value

Higher creator activity was followed by stronger interaction with generated content, indicating improving creator satisfaction

MONETIZATION EXPANSION

Premium adoption reflects creator willingness to pay for additional platform value

Methodology
Premium growth was measured using:
monthly premium subscription starts

Based on the premium growth trend, premium subscriptions increased steadily throughout 2023

The strongest monetization growth appeared during Q3–Q4 2023, indicating improving premium adoption

Increasing premium adoption may be linked to stronger creator engagement and improving content satisfaction

eklipse_test

SOCIAL DISTRIBUTION

According to the sharing trend, creator distribution activity accelerated significantly during Q4 2023.

Shared clip activity was aggregated monthly using shared_clips records

Sharing behavior contributes to organic platform exposure and creator reach

CONTENT PREFERENCES

Based on the content distribution chart, AI generated clips remain the platform's dominant creator workflow

Clip formats were grouped using clip_type categories from the clips dataset

The increasing usage of TikTok conversion clips also indicates growing demand for short form creator content

Strategic Takeaways

- Platform engagement strengthened throughout 2023
- Creator activity and sharing behavior increased significantly during Q3 – Q4 2023
- Download rates improved steadily, indicating stronger creator satisfaction
- Premium adoption continued growing, showing improving monetization performance
- AI generated clips remain the platform's core value proposition

Recommended Business Actions

- Strengthen creator onboarding experience
- Increase visibility of sharing features
- Expand premium exclusive features to support monetization growth
- Continue optimizing AI clip quality to strengthen creator satisfaction

Based on the analysis, creator engagement appears strongly connected to content interaction and monetization growth

ANALYSIS LIMITATIONS

Several limitations should be considered:

- Direct registration data was not available.
- Premium revenue information was not included in the dataset.
- Long term retention analysis was limited.
- Some timestamp fields contained missing values.
- External social platform performance could not be measured.

Despite these limitations, the datasets still provide meaningful insights into creator engagement, content interaction, and monetization behavior
